

Change log for Micromite MMBasic Ver 4.5C

- Corrected a bug which allowed the RND() function to return the number 1 (the specifications state that it must return a number from zero to less than 1).
- Fixed a bug that caused an error when the LENGTH keyword was used when defining a string array using the LOCAL command.
- Fixed a bug that kept resetting the variable used in the KEYPAD command to -1.
- Corrected a rare issue caused by some low cost USB-serial adapters that could cause V4.5 of the firmware to partially erase itself when there was a glitch in the power during start up. In that case the only solution was to re program the chip using a PIC32 programmer.

Note: V4.5 was the first release of MMBasic specifically for the Micromite
